The Nursing Process

The common thread uniting different types of nurses who work in varied areas is the nursing process—the essential core of practice for the registered nurse to deliver holistic, patient-focused care. One definition of the nursing process...“an assertive, problem solving approach to the identification and treatment of patient problems. It provides an organizing framework for the practice of nursing and the knowledge, judgments, and actions that nurses bring to patient care.”

Assessment

An RN uses a systematic, dynamic, rather than static way to collect and analyze data about a client, the first step in delivering nursing care. Assessment includes not only physiological data, but also psychological, sociocultural, spiritual, economic, and life-style factors as well. For example, a nurse's assessment of a hospitalized patient in pain includes not only the physical causes and manifestations of pain, but the patient's response—an inability to get out of bed, refusal to eat, withdrawal from family members, anger directed at hospital staff, fear, or request for more pain medication.

Dagnosis

The nursing diagnosis is the nurse's clinical judgment about the client's response to actual or potential health conditions or needs. The diagnosis reflects not only that the patient is in pain, but that the pain has caused other problems such as anxiety, poor nutrition, and conflict within the family, or has the potential to cause complications—for example: respiratory infection is a potential hazard to an immobilized patient. The diagnosis is the basis for the nurse's care plan.

Planning / Goal / Outcome

Based on the assessment and diagnosis, the nurse sets measurable and achievable short- and long-range goals for this patient that might include moving from bed to chair at least three times per day; maintaining adequate nutrition by eating smaller, more frequent meals; resolving conflict through counseling, or managing pain through adequate medication. Assessment data, diagnosis, and goals are written in the patient's care plan so that nurses as well as other health professionals caring for the patient have access to it.

Implementation

Nursing care is implemented according to the care plan, so continuity of care for the patient during hospitalization and in preparation for discharge needs to be assured. Care is documented in the patient's record.

Evaluation

Both the patient's status and the effectiveness of the nursing care must be continuously evaluated, and the care plan modified as needed.

Introduction

This teacher's resource provides a range of teaching and reference materials which have been developed to aid the teaching of the Cambridge International Examinations IGCSE® Computer Science syllabus (0478).

These resources support the Cambridge IGCSE Computer Science textbook (by Watson and Williams), which has been endorsed by Cambridge International Examinations.

Scheme of work

The scheme of work has been devised to follow a logical route through the new IGCSE® Computer Science textbook. Its aim is to complete the course by the end of the second term in the second year of study; this will then allow adequate time for revision and exam practice. It is assumed that students will have 3½ hours per week study time in this topic (total study time over 5 terms: 245 hours, comprising 145 hours for section 1 and 100 hours for section 2). To ensure a good balance, it is also assumed that sections 1 and 2 of the Cambridge syllabus will be taught side by side; the scheme of work will therefore assume 2 hours per week on section 1 of the syllabus (theory) and 1½ hours per week on section 2 of the syllabus (practical). Naturally this can be modified depending on resource allocation and other factors.

The relevant chapter and pages in the textbook and the syllabus references are detailed, as well as activities from the textbook; additional lesson notes are also included.

Answers

Answers to the end-of-chapter questions and (where relevant) the activities in the textbook are provided.

Examination-style questions

The Paper 1 examination-style questions with answers will be especially useful for teachers. They are based on the chapters in section 1 of the textbook. Teachers can select questions or question parts to make their own tests, or use the questions as provided. In general the level of difficulty of a question increases as the students work their way through the question. For example, all students should be able to tackle part a (shown with a green dot ●); most students should be able to tackle part b (shown with an orange dot ●); and those students aiming for the top grades should be able to tackle part c (shown with a purple dot ●). Answers for all questions have been provided, using this same colour coding. Sometimes there is additional commentary on the answers.

Program files

The Python and Java program files are for use with the activities and end-of-chapter questions.

Additional content in the textbook

Whilst asymmetric encryption is not in the present syllabus it was included in the textbook for two reasons:

- 1 to give a more complete picture on how encryption works (since student discussions may involve ways of improving the security of data by this method)
- 2 it is helpful to include asymmetric encryption when studying security systems on the internet such as SSL and TLS.
